

Logistic GLM: coverage calibration across nominal confidence levels

Zero denotes exact calibration. Grey vertical bars are 95% binomial Monte-Carlo reference ranges. Downward/upward triangles indicate coverage error outside the displayed range.

P2 and P3 have matched pointwise proxy MSE but different error structure. Full result: markers are medians across 30 outer seeds; thin colored whiskers show 2.5%–97.5% cross-seed robustness intervals; thick colored segments show IQRs; R=2000 replicates per seed. Main panels use adaptive focused y-axes within [0.75, 1.25]; ▲/▼ at the panel boundary indicate medians or robustness intervals extending beyond the displayed range.
