

Logistic GLM: inference validity and efficiency (95.0% confidence)

Grey band: 95% binomial Monte-Carlo reference range under exact calibration. Naive ML is omitted from relative-width panels because invalid coverage is not efficiency.

Full result: markers are medians across 30 outer seeds; thin colored whiskers show 2.5%-97.5% cross-seed robustness intervals; thick colored segments show IQRs; R=2000 replicates per seed. Main panels use adaptive focused y-axes within [0.75, 1.25];▲/▼ at the panel boundary indicate medians or robustness intervals extending beyond the displayed range.
